

# Activate All Affinity Studio Panels

This *MacOS Service* plugin runs an AppleScript that activates all inactive Studio panels for the currently running Affinity application.

## Installation

Double-click the “Activate All Affinity Studio Panels.workflow” file and click the “Install” button.

## Security

Before – or when – you run this Service with each respective Affinity app for the first time, go to System Preferences » Security » Privacy » Accessibility, and add all your Affinity apps to the list of “allowed” applications.

## Troubleshooting

If the plugin fails to open some panels, simply run it again.

If the plugin “hangs”, click the rotating cog symbol in the menu bar and cancel the process. Usually the process should not take more than a few seconds.
